

Invoice Email Reader & Auto-Logger

Make.com Automation — Gmail + Gemini AI + Google Sheets

Complete Project Documentation — Build Process, Live Screenshots & Test Results

GMAIL Email Trigger	HTTP MODULE Gemini AI	GOOGLE SHEETS Auto Logger	MAKE.COM Platform
-------------------------------	---------------------------------	-------------------------------------	-----------------------------

PROJECT OVERVIEW

This automation project reads incoming invoice emails automatically using Gmail, processes the email content with Google Gemini 2.5 Flash AI to extract key invoice details, and saves all the information directly into a Google Sheet — with no manual input required. The system was built, tested, and verified live on Make.com. This document covers the full build process, all test run results including errors encountered and resolved, and the final working configuration.

TOOL	ROLE	STATUS
Make.com	Automation platform — connects all modules	✓ Active
Gmail	Watches inbox, triggers on new emails	✓ Connected
Google Gemini 2.5 Flash	AI reads email and extracts invoice data via HTTP	✓ Working
Google Sheets	Receives extracted data and stores in rows	✓ Logging

MAKE.COM ACCOUNT & USAGE

The screenshot below shows the Make.com dashboard confirming the account is active with available free credits. As of testing, only 31 out of 1,000 free monthly credits were used (3%) — confirming the automation runs at virtually zero cost.

Screenshot 1: Make.com dashboard — 31/1,000 credits used (3%), 161.4KB/512MB data transfer (0%)

- Free plan: 1,000 operations per month — more than enough for invoice email automation
- Data transfer: 161.4KB used out of 512MB — 0% of free allowance consumed
- 25 days remaining on current billing cycle — system is running and active

THE AUTOMATION WORKFLOW

The workflow was built as a 3-module linear pipeline inside Make.com. Each module connects to the next automatically when triggered.

Screenshot 2: Make.com workflow diagram — Gmail (Watch emails) → HTTP (Gemini AI) → Google Sheets (Add a Row)

MODULE	WHAT IT DOES
--------	--------------

Module 1 — Gmail (Watch emails)	Monitors the Gmail inbox. When a new email arrives, it triggers the rest of the workflow automatically. Runs every 15 minutes.
Module 2 — HTTP (Gemini AI)	Sends the email content as a POST request to the Gemini 2.5 Flash API. Gemini reads the email and identifies invoice details such as vendor name, amount, due date, and other relevant fields.
Module 3 — Google Sheets (Add a Row)	Takes the data returned by Gemini and writes it into a new row in the Google Sheet. Each invoice email creates one new row with all extracted details organised into columns.

GOOGLE SHEETS FIELD MAPPING CONFIGURATION

The screenshot below shows the exact field mapping configured inside the Google Sheets module — showing which email data fields map to which spreadsheet columns.

Screenshot 3: Google Sheets module field mapping — Gmail and Gemini AI data mapped to spreadsheet columns

COLUMN	FIELD MAPPED	DATA SOURCE
Column A — Vendor	Sender / vendor name from email	Gmail trigger
Column B — Amount	Invoice amount extracted by Gemini AI	Gemini AI output
Column C — Due Date	Payment due date extracted from email	Gemini AI output

Screenshot 6: DataError in Google Sheets module — 'Failed to map values.0: Function map finished with error! Invalid array'

■ Error: Data couldn't be processed — Failed to map 'values.0': Function 'map' finished with error! Invalid array. Code: DataError

What caused this error:

- The Google Sheets module tried to write data into a column but the data from Gemini AI came back as an array (list) instead of a single value
- This happens when the HTTP module returns nested JSON and the mapping points to a list instead of a specific text value

How to fix this error:

- In the Google Sheets module, click on the field that is causing the error
- Instead of mapping the full array, drill down into the specific text value inside the array — for example: select 'Data > candidates > 0 > content > parts > 0 > text' from the Gemini response
- Alternatively, add a 'Set Variable' module between HTTP and Google Sheets to extract and clean the text first

■ The successful run (June 9, 2026 at 11:45:08 PM) confirms the error was resolved and the automation completed in 3 seconds with all 3 operations successful

SUCCESSFUL TEST RUN — FINAL RESULTS

After resolving the mapping error, the automation ran successfully. The screenshots below show the successful run history and the detailed execution log.

Screenshots 7 & 8: Successful run details and full history log — multiple runs completed on June 9, 2026

RUN DETAIL	VALUE
Date & Time	June 9, 2026 at 11:45:08 PM
Duration	3 seconds — complete end-to-end execution
Operations	3 out of 3 completed successfully
Gmail Watch emails	Completed in 0.2 seconds
HTTP — Gemini AI	Completed in 2.8 seconds
Google Sheets Add Row	Completed in 0.9 seconds
Data Processed	12.8 KB
Total Test Runs	Multiple runs on June 9, 2026 — Manual and Replay
Cost	NGN 0 — all within free tier

SKILLS DEMONSTRATED

SKILL	EVIDENCE FROM THIS PROJECT
AI & Automation	Built a 3-module Make.com automation connecting Gmail, Gemini AI, and Google Sheets — fully tested live
Problem Solving	Encountered <code>DataError</code> in Google Sheets mapping, diagnosed the root cause, and resolved it to achieve a successful run
Data Organisation	Configured column mapping (Vendor, Amount, Due Date + 5 more) to organise invoice data systematically
Process Optimisation	Reduced invoice data entry from manual (5-10 min per email) to automatic (3 seconds) — 99% time saving
Virtual Operations	System runs every 15 minutes automatically — no human presence required at any point
